1. Foreword

1.1 Introduction

Congratulations on choosing the Wallenstein BXTR5224 Trailer Wood Chipper!

This machine is designed and manufactured to meet the needs of the timber and landscaping industries, as well as township and municipal requirements.

Review all safety, operation and maintenance information contained in this manual.

Safe, efficient and trouble-free operation of this Wallenstein product requires that anyone using or maintaining the machine reads and understands the Safety, Operation, Maintenance information contained within the Operator’s Manual.

Keep this manual handy for frequent reference and to pass on to new operators or owners. Call your Wallenstein dealer or the distributor if you need assistance, information or additional copies of the manuals.

Units of measurement in Wallenstein Equipment technical manuals are written as:
US Customary (SI metric)

Keep this manual handy for reference. Pass it on to new operators or owners. Call your Wallenstein dealer or the Distributor if you need assistance, information or additional copies of this manual.
# Table of Contents

# Delivery Inspection Report

**Wallenstein BXTR5224 Trailer Wood Chipper**

To activate warranty, register your product at: [www.wallensteinequipment.com](http://www.wallensteinequipment.com)

This form must be filled out by the dealer at the time of delivery, then signed by the dealer and customer.

The product manuals have been received by me and I have been thoroughly instructed as to care, adjustments, safe operation, and applicable warranty policy. I have thoroughly instructed the buyer on the equipment care, adjustments, safe operation and applicable warranty policy and reviewed the manuals.

1.3 Serial Number Location

Always provide the serial number of your Wallenstein product when ordering parts or requesting service or other information. The Serial Number Plate location is shown in the illustration.

Record the product Serial Number in the space provided below for future reference.

<table>
<thead>
<tr>
<th>Record Product Information Here</th>

Fig. 1—Serial Number Plate Location
1.5 Types of Decals on the Machine

When getting familiar with the Wallenstein product, notice that there are numerous decals located on the machine. There are different types of decals for safety, information, and product identification. The following section explains what they are for and how to read them.

**Safety Decals** have a yellow background and are generally two panel. They can be either vertical or horizontal.

**Safety Notice Decals** are pictorial with a blue background and generally rectangular with single or multiple symbols. This decal informs what Personal Protective Equipment is required for safe operation.

**Informative Decals** are generally pictorial with a white background and can vary in the number of panels. This type of decal explains how a control works.

**Product Decals** indicate machine model and serial number, and other important information.

**Maintenance Decals** have a green background and can vary to the number of panels. This decal shows a type maintenance required and frequency interval.

See the section on safety signs for safety decal definitions. For a complete illustration of decals and decal locations, download the parts manual for your model product at [www.wallensteinequipment.com](http://www.wallensteinequipment.com).
2. Safety

2.1 Safety Alert Symbol

This Safety Alert Symbol means:

**ATTENTION! BE ALERT!**
**YOUR SAFETY IS INVOLVED!**

The Safety Alert Symbol identifies important safety messages on the Wallenstein wood chipper and in the manual. When you see this symbol, be alert to the possibility of personal injury or death. Follow the instructions in the safety message.

2.2 Signal Words

The signal words **DANGER**, **WARNING** and **CAUTION** determine the seriousness level of the warning messages in this manual. The appropriate signal word for each message in this manual has been selected using the following guidelines:

**DANGER** –
Indicates an imminently hazardous situation that, if not avoided, will result in death or serious injury. This signal word is to be limited to the most extreme situations typically for machine components which, for functional purposes, cannot be guarded.

**WARNING** –
Indicates a potentially hazardous situation that, if not avoided, could result in death or serious injury, and includes hazards that are exposed when guards are removed. It may also be used to alert against unsafe practices.

**CAUTION** –
Indicates a potentially hazardous situation that, if not avoided, may result in minor or moderate injury. It may also be used to alert against unsafe practices.

**IMPORTANT** – To avoid confusing equipment protection with personal safety messages, a signal word IMPORTANT indicates a situation that if not avoided, could result in damage to the machine.

2.3 Why SAFETY is Important

Three Big Reasons:

- Accidents Disable and Kill
- Accidents Cost
- Accidents Can Be Avoided

The policy of Wallenstein Equipment Inc. is to produce products that are safe and reliable. However, even when using well-engineered equipment, there is always an element of risk. To minimize the risks and promote safety at all times, this section of the operator’s manual details a number of safety rules that must always be followed and obeyed.

YOU are responsible for the SAFE operation and maintenance of your Wallenstein Trailer Wood Chipper. YOU must ensure that you and anyone else who is going to use, maintain or work around the wood chipper be familiar with the operating and maintenance procedures and related safety information contained in this manual. This manual provides good safety practices that should be followed while using the wood chipper.

Remember, YOU are the key to safety. Good safety practices not only protect you but also the people around you. Make these practices a working part of your safety program. Be certain that EVERYONE using this equipment is familiar with the recommended use and maintenance procedures and follows all the safety precautions.

Do not risk injury or death by ignoring good safety practices.
2.4 Safety Rules

- **DO** give operating instructions to operators or employees before allowing them to operate the machine, and REVIEW annually thereafter.
- **DO** read and understand ALL Safety and Operating instructions in the manual and follow them. The most important safety device on this equipment is a SAFE operator.
- **DO** review safety related items annually with all personnel who are operating the machine or performing maintenance.
- **DO** wear appropriate Personal Protective Equipment (PPE). The suggested equipment includes but is not limited to the following:
  - Hearing Protection
  - Protective glasses, goggles or face shield
  - Heavy work gloves
- **DO** have a first-aid kit available for use should the need arise and know how to use it.
- **DO** read and understand all safety signs located on the machine before operating, servicing, adjusting, or cleaning.
- **DO** inspect and secure all guards before starting.
- **DO** check input and discharge chutes, engine intake and exhaust. Make sure they are clear of debris prior to starting the machine.
- **DO** inspect and secure all guards before starting.
- **DO** have a fire extinguisher available for use should the need arise. Know how to use it.
- **DO** think SAFETY! Work SAFELY!
- **DO NOT** touch hot engine parts, muffler cover, hydraulic hoses, engine body, engine oil, and so on during operation or if the engine was recently shut off. Contact may cause burns.
- **DO NOT** expect a person who has not read and understood all operation and safety instructions to use the machine. An untrained operator is not qualified and is exposed to possible serious injury or death. It is the owner’s responsibility to make sure to the operator has familiarity and understanding of the machine.
- **DO NOT** modify, disable or change the roller feed safety / control bar in any way.
- **DO NOT** allow riders during transport.

2.5 Equipment Safety Guidelines

- Always place the machine in a safe service position before performing any service work, maintenance procedures, or storage preparation. The **Safe Condition** is as follows:

<table>
<thead>
<tr>
<th><strong>SAFE CONDITION</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Shut off engine. Remove ignition key.</td>
</tr>
<tr>
<td>Make sure all moving parts have stopped.</td>
</tr>
<tr>
<td>Disconnect battery ground (-) cable.</td>
</tr>
<tr>
<td>Block or chock wheels.</td>
</tr>
</tbody>
</table>

- Never use equipment with safety shields removed. Keep all shields in place. If shield removal becomes necessary for repairs, reinstall the shield prior to use.
- Replace any safety sign or instruction sign that is not readable or is missing. Location of safety signs is indicated in this manual.
- Do not allow anyone other than a responsible, properly trained and physically able person to operate this machine. This equipment is dangerous to children and persons unfamiliar with its operation.
- Do not modify the equipment in any way. Unauthorized modification may result in serious injury or death and may impair the function and life of the equipment.
- Never exceed the limits of the machine. If its ability to do the job or to do it safely is in question— **STOP IMMEDIATELY**!

2.6 Safety Training

- The best safety feature is an informed, careful operator—we ask you be that kind of operator. It is the operator’s responsibility to read, understand and follow ALL safety and operation instructions in the manual.
• Train all new personnel and review instructions frequently with existing workers. Only properly trained and physically able operators should use this equipment. **A person who has not read and understood all operation and safety instructions is not qualified to use the machine.** Untrained operators expose themselves and bystanders to possible serious injury or death. If elderly people are assisting with the work, their physical limitations need to be recognized and accommodated.

• Learn the controls and how to stop the machine quickly in an emergency.

• If this machine is loaned or rented, it is the machine owner's responsibility to make certain that every operator:
  - reads and understands the owner's manual
  - is instructed in safe and proper use of the equipment
  - understands and knows how to perform the Safe Condition procedure

### 2.7 Be Prepared

• Wear appropriate personal protective equipment. Tie back long hair, remove jewelry, and avoid loose fitting clothing. Prolonged exposure to loud noise can cause permanent hearing loss! Wear hearing protection on a full-time basis when using this machine.

• Keep bystanders at safe distance at least 20 ft (6 m) from work zone. Mark the zone with safety cones.

• Determine where chips are piled and ensure the location does not interfere with safe operation of the machine.

• Determine a safe work area location:
  - area must be clear of stones, branches or hidden obstacles that might cause a tripping, hooking or snagging hazard
  - ground should be firm and level

• Be aware of overhead hazards such as branches, cables, or electrical wires.

• Operate only in daylight or good artificial light.

• Make sure machine is properly adjusted and in good operating condition.

• Store fuel well away from the material pile.

• Perform the **Pre-operation Checks** procedure before starting work (see page 33).

### 2.8 Operating Safety

Read and obey the safety signs on the machine. Clean or replace them if they are not legible. There is no substitute for a cautious, safe-minded operator who recognizes potential hazards and follows reasonable safety practices. This machine must be used with all its safety equipment properly installed to minimize the chance of accidents.

• When operating this equipment always have at least two workers present and trained in safe operation of the machine.

• The operator must be in control of the machine at all times. The spotter must remain out of the danger zone while the machine is in operation. Bystanders must remain in the safe zone.

• Do not overreach into the hopper. Keep proper balance and footing at all times.

• Feed rollers can cause serious injury or death. Keep hands, feet and clothing away from the feed roller.

• Never allow anyone to sit on the feed table.

• Do not put metal objects, bottles, cans, rocks, glass or other foreign material into wood chipper. If such items happen to get into the chipper, stop machine and turn engine off. Wait for all moving parts to stop before removing material. Inspect machine for damaged or loose parts before resuming work.

• Make sure all guards, deflectors and shields are in place before starting and operating.

• Read and understand owner's manual before starting. Review safety instructions annually.

• Personal protective equipment is recommended during assembly, installation, operation, adjustment, maintaining, repairing, removal, or moving. Do not allow long hair, loose-fitting clothing, or jewelry to be around moving parts.

• Do not allow anyone within the work or danger zone during operation. Ejected wood chips can cause injuries. Keep children away.

• Never place any part of your body where it would be in danger if machine movement should occur during assembly, installation, operation, maintenance, repairing, unplugging or moving.

• Inspect electrical harness, sensors and controller to make sure they are in good condition before operating.

• Before servicing or repairing the machine, place it in a **Safe Condition. See page 8.**

• Do not operate on hillsides or when working area is cluttered, wet, muddy or icy to prevent slipping and tripping. Operate only on level ground.

• Position machine so prevailing winds blow engine exhaust fumes away from operator's station.

• Never use engine-powered machinery indoors. Gas engine exhaust contains toxic carbon monoxide, which cannot be smelled or seen. Breathing carbon monoxide can be lethal.
• Stop engine when leaving the machine unattended.

2.9 Feed Roller Safety
• Do not overreach into the hopper. Keep proper balance and footing at all times.
• Feed rollers can cause serious injury or death. Keep hands, feet and clothing away.
• Never climb onto the feed table or hopper when the chipper is operating or running.
• Never allow anyone to sit on the feed table.

2.10 Transport Safety
• Comply with local laws governing safety and transporting of machinery on public roads.
• Do not exceed 50 mph (80 km/h) when towing this machine. Slow down for rough terrain and cornering.
• Do not transport or move the wood chipper with the engine running.
• Ensure all latch handles are secure.
• Be sure the trailer is hitched correctly to the towing vehicle and a retainer is used through the hitch mechanism.
• Always attach safety chains between the hitch and the towing vehicle. Cross the chains underneath the trailer tongue.
• Check wheel lugs and tighten if required. Inspect rims for damage.
• Inspect tires for cuts or damage. Check tire pressure and adjust if required.
• Ensure the stability jacks are raised and secured with the latch pin.
• Make sure tow vehicle is fitted with the correct size (2 in) towing ball.
• Inspect all access panels and guards to ensure they are secured.
• Make sure fuel and hydraulic tank caps are on tight to prevent spills while transporting.
• Clean all debris off the chipper. Remove any tools or other loose items.
• Check that all the lights, reflectors and other lighting requirements are installed and in good working condition.
• Never allow riders on the machine.
• Be a safe and courteous driver. Always yield to oncoming traffic in all situations, including narrow bridges, intersections, and so on.
• Watch for other traffic when near or crossing roadways.
• Do not drink and drive.

2.11 Refueling Safety
• Engine fuel is highly flammable. Handle with care.
• Fill fuel tank outdoors.
• Stop the engine before refueling. Allow engine to cool for five minutes. Clean up spilled fuel before restarting engine.
• Do not overfill the fuel tank.
• If fuel is spilled, wipe it away carefully and wait until the fuel has dried before starting the engine.
• Do not refuel the machine while smoking or when near open flame or sparks.

• After refueling, make sure that the fuel cap is secured to prevent spillage.
• Prevent fires by keeping machine clean of accumulated trash, grease, and debris.

2.12 Tire Safety
• Failure to follow proper procedures when mounting a tire on a wheel or rim can produce an explosion which may result in serious injury or death.
• Do not attempt to mount a tire unless you have the proper equipment and experience to do the job.
• Have a qualified tire dealer or repair service perform required tire maintenance.
• When replacing worn tires, make sure they meet the original tire specifications. Never install undersized tires.

2.13 Battery Safety

CAUTION!
Risk of burns! Battery electrolyte is extremely corrosive and poisonous. Contact with the eyes, skin, or clothing can result in severe burns or other serious personal injury. If contact occurs seek medical attention immediately. Handle batteries carefully.

• Wear gloves and safety glasses or face shield when working on or near batteries.
• Use a battery carrier to lift the battery or place hands at opposite corners to avoid spilling acid through the vents.
2.14 Hydraulic Safety

- Make sure that all the components in the hydraulic system are kept in good condition and are clean.
- Before applying pressure to the system, make sure all components are tight, and that lines, hoses and couplings are not damaged.
- Do not attempt any makeshift repairs to the hydraulic lines, fittings or hoses by using tapes, clamps or cements. The hydraulic system operates under extremely high pressure. Such repairs can fail suddenly and create a hazardous and unsafe condition.
- Wear proper hand and eye protection when searching for a high pressure hydraulic leak. Use a piece of wood or cardboard as a backstop instead of hands to isolate and identify a leak.
- If injured by a concentrated high-pressure stream of hydraulic fluid, seek medical attention immediately. Serious infection or toxic reaction can develop from hydraulic fluid piercing the skin surface.
- Relieve pressure in the hydraulic system before working on it.

2.15 Gas Engine Safety

CAUTION!

Before starting engine, review the operating and maintenance instructions in the engine manual.

- DO NOT operate engine in an enclosed area. Exhaust gases contain odorless and deadly carbon monoxide that can cause death by asphyxiation.
- DO NOT place hands or feet near moving or rotating parts.
- DO NOT store, spill, or use gasoline near an open flame, or devices such as a stove, furnace, or water heater which use a pilot light or devices which can create a spark.
- DO NOT refuel indoors where area is not well ventilated.
- DO NOT refuel while engine is running. Allow engine to cool for five minutes before refueling. Store fuel in approved safety containers.
- DO NOT remove fuel tank cap while engine is running.
- DO NOT operate engine if gasoline is spilled. Move machine away from the spill and avoid engine ignition until gasoline has evaporated.
- DO NOT smoke while filling fuel tank.
- DO NOT choke carburetor to stop engine. Whenever possible, gradually reduce engine speed before stopping.
- DO NOT run engine above rated speeds. This may result in injury.
- DO NOT tamper with governor springs, governor links or other parts which may increase the governed speed.
- DO NOT tamper with the engine as set by the original equipment manufacturer.
- DO NOT check for spark with spark plug or spark plug wire removed.
- DO NOT crank engine with spark plug removed. If engine is flooded, crank until engine starts.
- DO NOT strike flywheel with a hard object or metal tool as this may cause flywheel to shatter in operation. Use proper tools to service engine.
- DO NOT operate engine without a muffler. Inspect periodically and replace, if necessary.
• **DO NOT** operate engine with an accumulation of grass, leaves, dirt or other combustible materials in the muffler area.

• **DO NOT** use this engine on any forest covered, brush covered, or grass covered unimproved land unless a spark arrester is installed on the muffler. The arrester must be maintained in effective working order by the operator. In the state of California, the above is required by law (Section 4442 of the California Public Resources Code). Other states may have similar laws. Federal laws apply on federal land.

• **DO NOT** touch hot muffler, engine body or cooling fins. Contact may cause burns.

• **DO NOT** run engine with air cleaner or air cleaner cover removed.

**Be sure to:**

• Remove the wire from the spark plug when servicing the engine or equipment to prevent accidental starting. Disconnect the ground (-) wire from the battery terminal.

• Keep engine cooling fins and governor parts free of grass and other debris that can affect engine speed.

• Examine muffler periodically to be sure it is functioning effectively. A worn or leaking muffler should be repaired or replaced as necessary.

• Use fresh gasoline. Old fuel can clog carburetor and cause leakage.

• Check fuel lines and fittings frequently for cracks or leaks. Replace if necessary.
2.16 Sign-Off Form

Anyone using this machine must read and thoroughly understand all Safety, Operation and Maintenance information in this manual. An untrained operator should never use this machine.

To help document this training, the sign-off sheet provided below can be used.

Make periodic reviews of Safety and Operation a standard practice for all operators. Review again at the startup of every season.

The design and manufacture of this product conforms to relative provisions in the following standards:

- ISO 4254-1 Agricultural machinery – Safety
- ASABE S318 Safety for Agricultural Field Equipment
- ISO 3600 Operator’s Manual – Machinery for Agriculture, Forestry & Lawn Equipment

2.17 Safety Sign Explanations

The top (or left-hand) panel shows the safety alert (the potential hazard), and the bottom (or right-hand) panel shows the message (how to avoid the hazard).

Practicing good safety means becoming familiar with safety signs and warnings and being aware of the situations that require alertness.

Think SAFETY! Work SAFELY!
Fig. 3—BXTR5224 Safety Decals
1. **Caution!**
Risk of injury from flying objects. Stay clear of material discharge chute. Machine can expel wood chips fast enough to cause injury.
Do not point discharge at people, animals, or buildings.

2. **Warning!**
Rotating parts are exposed or under a guard. Do not attempt to reach in while parts are rotating.
Keep hands, loose clothing, and long hair away. Serious injury can result.

3. **Warning!**
Risk of burns to exposed skin from hot surfaces.
Stay clear of hot exhaust system.

4. **Warning!**
Risk of explosion.
Do not jump start / charge a frozen battery. Frozen batteries can explode and result in serious injury. Let battery thaw before charging.

5. **Warning!**
Risk of high pressure hydraulic fluid piercing exposed skin.
Do not check for leaks with hand or fingers. Serious injury can result.

6. **Warning!**
Risk of explosion.
Do not refuel the machine while smoking or near open flame or sparks. Serious injury can result.
7. **Caution!**
Risk of serious injury or death if hands or limbs are caught in rotating parts.

Do not operate machine without shields in place. If shield is removed, replace it before operating machine.

8. **Warning!**
Risk of serious injury or death if hands or limbs are caught in rotating parts.

Do not attempt to reach in while parts are turning. Keep hands, loose clothing, and long hair away.

9. **Warning!**
Risk of serious injury. Keep hands and feet out of inlet and discharge openings while machine is operating.

Wait for all moving parts to come to a complete stop before clearing obstructions.

10. **Caution!**
Risk of personal injury or equipment damage.

Do not put material larger than 5.0" (125 mm) diameter into the chipper. Attempting to chip anything larger could stall the engine, damage the machine or cause personal injury.

11. **Warning!**
Personal Protective Equipment (PPE) is required when operating this machine.

- A hard hat
- Hearing protection
- Protective glasses, goggles or face shield
- Protective shoes with slip resistant soles
- Heavy gloves

Failure to wear PPE can result in personal injury.

12. **Caution!**
Refer to the operator’s manual. Read ALL operating instructions in the manual and learn the meaning of ALL safety signs on the machine.

The best safety feature is an informed operator.
13. Caution!
Risk of serious injury or death if the engine is not shut off during maintenance procedures.

Shut off the engine and remove the key.

IMPORTANT! If parts are replaced that have safety signs on them, new signs must be applied. Safety signs must always be replaced if they become damaged, are removed, or become illegible.

Safety signs are included in the product decal kit available from your authorized dealer. Decals are not available separately.

2.17.1 Replacing Damaged Safety Signs
- Always keep safety signs clean and legible.
- Replace safety signs that are missing or have become illegible.
- Parts that were replaced with a safety decal on them must also have the safety sign replaced.
- Replacement safety signs are available from your authorized Distributor, Dealer Parts Department, or Wallenstein Equipment.

Procedure
1. Be sure that the installation area is clean and dry.
2. Be sure temperature is above 50 °F (10 °C).
3. Determine exact position before removing from the backing paper.
4. Pull the decal off the backing sheet, align the sign over the specified area, then carefully press the exposed sticky backing in place.
5. Use a piece of the backing paper to smooth the decal out, pressing from the center outwards.
6. Small air pockets can be pierced with a pin and smoothed out using the piece of sign backing paper.
3. Familiarization

3.1 To the New Operator or Owner

It is the responsibility of the owner or operator to read this manual and to train all other operators before they start working with the machine. Follow all safety instructions. Untrained operators are not qualified to use the machine.

1. Review control location, function and movement directions.
2. Move the unit to a large open area to allow the operator to become familiar with control function and machine response. When a new operator is familiar and comfortable with the machine, they can proceed with the work.
3. Do not allow untrained operators to use the machine. They can endanger themselves and others or damage property and the machine.

IMPORTANT! Make sure all operators understand how to put the machine in a safe service position before servicing or repairing. See page 8.

3.2 Job Site Familiarization

It is the responsibility of the operator to be thoroughly familiar with the work site prior to starting. Prevent the chance or possibility of problems or accidents by avoiding unsafe situations.

Some items operators should check include, but are not limited to:

1. Avoid close or cramped work spaces. Be sure there is enough space and clearance for the machine.
2. Position the machine so prevailing winds blow engine exhaust fumes and chain saw chips away from operator's station.
3. Choose flat and level ground and make sure the machine is level before operating.
4. Avoid muddy or soft ground as the jacks will sink in. If unavoidable, use boards or plates to increase the surface area of the jack feet.

3.3 Operator Orientation

IMPORTANT! When describing controls throughout this manual, the directions for left-hand, right-hand, backward and forward are determined when standing at the operator controls facing the direction of forward machine travel.

![Fig. 4—Direction of Forward Machine Travel](image-url)

27. Hydraulic Tank

Fig. 5 – Machine Components
4. Controls

IMPORTANT! Before starting work with the chipper, become familiar with the location and function of all controls.

4.1 Engine Controls

Refer to the engine manual for further explanation on engine controls.

4.1.1 Throttle Lever

The Throttle Lever controls engine speed. Warm up the engine before putting the chipper to work. The throttle lever should be at the MAX position during chipper operation.

- Pull the lever up to increase engine speed.
- Push the lever down to decrease engine speed.

4.1.2 Choke Knob

The Choke Knob is used as a starting aid when the engine is cold. Pulling the knob out supplies a richer fuel mixture to aid the engine in starting.

- Pull the knob out to apply (close) the choke when starting a cold engine.
- Push the knob in gradually to turn off (open) the choke as the engine warms.

---

**Fig. 6—Engine Controls**

1. Throttle Lever
2. Choke Knob
3. Engine Start Switch
4. Low Oil Level Alert Indicator
5. Engine Hour Meter

**Fig. 7—Throttle Lever**

**Fig. 8—Choke Knob**
4.1.3 Engine Start Switch
The Engine Start Switch has three positions—OFF, ON, and START.

![Engine Start Switch Diagram]

- **OFF** – In the OFF position, there is no power to the engine and fuel supply is turned off. Turn the switch fully counter-clockwise to shut the engine off.
- **ON** – In the ON (run) position, the fuel supply solenoid supplies fuel to the engine. The machine operates in this position.
- **START** – In the START position, the engine electric starter is activated. When released, the switch springs returns to ON.

4.1.4 Engine Hours and Oil Level Alert
Refer to the engine manual for further information.

![Engine Hour and Oil Level Alert Diagram]

1. Engine Oil Level Alert Indicator Light (Red)
2. Engine Operating Hours

4.2 Discharge Chute
The discharge chute can be rotated 360°. It has a spring-loaded latch that locks it in position.

1. Lift the latch handle up to disengage the lock pin.
2. Use grip handles and rotate the chute.
3. Release the handles and lock the chute into position at the nearest lock point.

![Discharge Chute Diagram]

4.3 Hood Deflector
The Hood Deflector is on the end of the discharge chute to direct the chip output. The deflector is held in position by a slotted position handle.

1. Grasp the handle and lift slightly to clear the handle cogs.
2. Move the deflector with the handle as required.
3. Lock the deflector into position by lowering the handle into one of the slots.
4.4 Feed Roller Control Bar

**WARNING!**
Risk of serious injury or death. Keep hands, feet and clothing away from feed rollers when the chipper is operating. Do not climb onto the feed table or hopper.

The Feed Roller Control Bar on the back of the hopper controls the material feed into the chipper. The control bar has four positions—Stop, Forward, Reverse, Stop. Decals on the side of the feed table indicate feed control bar operation.

The control bar can be moved freely between Forward and Reverse. Once moved into either Stop position, the bar is locked there until the Detent Release Lever is pulled up to release it.

### 4.4.1 STOP Positions

Stop the feed rollers at any time by pushing the control bar fully forward or pulling it fully rearward.

- Push the control bar fully **forward** (towards the feed table) into the maximum detent position to stop the feed roller.

- Pull the feed roller control bar fully **rearward** (away from the feed table) to the maximum detent position to stop the feed rollers.
• To move the control bar out of either Stop position, lift up the Detent Reset Lever to release it.

4.4.2 Forward (Feed) – Position 2
• Lift up the detent reset lever, push the feed roller control bar forward to the first detent position to start the forward feed. This is the normal operating position. The control bar stays in this position until moved.

4.4.3 Reverse – Position 3
• Push the control bar forward to the next detent position to reverse the feed rollers.

NOTE: The feed roller control bar can move freely between Forward and Reverse without locking.
4.5 P3 PULSE Electronic Control System

4.5.1 Overview
The Wallenstein P3 PULSE Electronic Control System optimizes the capacity of the chipper. Operators can adjust feed settings to customize chip size when chipping any type of material. P3 tracks rotor hours of operation and provides system diagnostics. In the unlikely event the rotor becomes jammed with material, P3 quickly stops the engine to prevent clutch burn out.

P3 keeps the chipper working in the peak working range by matching feed rate with rotor speed. As material is put into the chipper, a sensor on the rotor sheave continually monitors rotor rpm. If the rotor slows down under load, P3 slows the feed roller speed allowing the rotor to recover. If it slows below the minimum rotor speed setting, P3 auto-reverses the feed rollers preventing a stall out. Wood material is then pulled away from the rotor giving it the opportunity to regain speed. Once back at operating rpm, the feed rollers start feeding material into the chipper again.

P3 PULSE consists of a rugged, user-friendly 4.3" (109 mm) display and electronic controller. From the display, the user can see all the important operating parameters. These parameters are set up depending on machine model.

Navigating through the menus is done with the four soft keys below the display screen. Icons in the display above the soft keys indicate menu selection options.

IMPORTANT! Graphical display and controller are not serviceable. Return to the factory in the event of failure.

4.5.2 Start-up Screen
The start-up screen displays briefly with P3 PULSE™ logo when the key is turned ON.
4.5.3 User Interface

1. Display Screen
   The Display Screen is the user interface for the P3 PULSE Electronic Control System. The screen is an anti-glare coated, 4.3 in (109 mm) color display. The system is controlled by navigating through the soft key buttons.

2. Soft Key Indicator Icons
   These icons are displayed directly above the Soft Key Navigation Buttons. They indicate your current selection options and are only shown when that selection is available.

   - Settings
   - Home
   - Up Arrow
   - Down Arrow
   - Select a value (enter)
   - Cancel

3. Navigation Soft Keys
   Navigate through information and configuration screens using the four context-dependent soft keys located on the front of the display.
4.5.4 Menus

Main screen

The Main screen is the default screen with the ignition key in the ON position. Pressing the key below Home icon in any sub menu takes you back to the Main screen.

If the display is left unattended for a period (approximately 60 seconds), the system returns to the Main screen.

The Main screen displays:

- Feed Position (feed roller rotation direction)
- Rotor Speed (rpm)
- Hours (rotor hours of operation)
- Settings Icon

1. Feed Position

Feed roller drive position is displayed with colored icons to indicate direction.

- REVERSE (red arrows) – feed rollers are reversing. Material in the rollers is being pulled back away from the rotor.
- NEUTRAL (amber) – feed rollers are stopped.
- FORWARD (green arrows) – feed rollers are going forward. Material in the rollers is pushed into the rotor.
- LOW RPM (green arrows) – with the feed control bar in Forward, feed rollers are not moving because rotor RPM is too low for chipping. Once engine speed is increased above the minimum start speed, FORWARD is displayed.

2. Rotor Speed (rpm)

Displays the speed (revolutions per minute) the rotor is turning. A value of 0000 indicates the rotor is not turning.

3. Hours

Counts the total operating hours of the rotor. This value is not resettable. (Engine hours are displayed on the hour meter beside the ignition key. Use Engine Hours as a service interval guide.)

4. Settings

Press the soft key button below Settings icon to navigate to the Settings screen.
Settings screen
Press the soft key button below the icon to access Settings. This is the main screen to set up all your machine parameters. All settings are retained when the machine is shut down.

The Settings screen menu contains:

- Feed Settings – Set the maximum and minimum feed roller speed settings, feed roller start rpm, minimum feed roller speed.
- Reset Defaults – Returns all settings to the factory default values.
- Diagnostics – Provides an overview of operating parameters; rotor speed, solenoid valve current, feed roller position. Used for debugging and testing purposes.
- Select Machine – Chose machine model to set the default operating parameters for your machine.
- Enter Password – This password protected menu provides access to factory settings.

Use the Up and Down arrows to cycle through the menus. The active selection is highlighted.

Press the soft key below icon to select that menu.

Feed Settings screen
Feed Settings screen provides access to the four main P3 PULSE program settings.

The active selection is highlighted. Pressing advances to the next setting. Max Feed Speed is the first menu accessed.

- To make adjustments within any menu, press to advance to that menu, then use Up and Down arrows to make any changes.
- Pressing saves your new setting and advances to the next menu to the right. Press as required to exit back to Settings screen.
Max Feed Speed

Sets the maximum feed roller speed in 5% increments. The value is shown as a percentage of the maximum speed (100%).

• Set Max Feed Speed higher for larger chip size. It can be set and left at 100%.
• Set it lower close to Min Feed Speed for smaller consistent chip size.

Min Feed Speed

Sets the minimum feed roller speed in 5% increments. The value is shown as a percentage of the maximum speed (100%). Setting Min Feed Speed higher allows larger chip size and prevents the chipper from slowing up as much when wood is put through.

(Min Feed Setting cannot be set any higher than 5% below Max Feed Setting.)

Feed Start Speed

Sets the rpm point where feed rollers start up.

Min Rotor rpm

Sets the low rpm point where the feed rollers auto-reverse. If the rotor speed slows down under load below this setting, P3 auto-reverses the feed rollers. Once the rotor regains speed, Forward feed resumes. If the engine stalls out, the Minimum Rotor rpm is set too low.

Programming Hints

The factory settings provide good overall performance for the machine selected, however you may choose to customize performance. Here are some helpful hints:

• For very heavy brush – decrease Max Feed Speed to slow feed roller speed.
• To get smaller, consistent chip size – decrease Max Feed Speed closer to Min Feed Speed.
• Larger chip sizes and more aggressive feeding – Leave Max Feed Speed at 100% and raise Min Feed Speed.
Reset Defaults screen

P3 PULSE setup parameters can be returned to the factory settings if desired.

- From the **Settings** screen, use the Up or Down arrows to navigate to **Reset Defaults**.
- Press to reset all P3 settings back to factory default values.
- The next screen asks you to confirm the reset. Press the key below to reject and to accept.
- If you press to cancel, the menu returns back to the **Settings** screen without changing your setup.
- If you press to accept, P3 reboots and resets all settings to factory default values.

![Fig. 24—Reset Defaults Screen](image1)

Diagnostics screen

The **Diagnostics** screen displays default settings, feed roller direction, and electrical current supplied to the Forward solenoid on the control valve.

**Diagnostics** is typically used for debugging and testing purposes by technicians. During operation, observe all machine settings from this screen.

![Fig. 25—Diagnostics Screen](image2)
**Machine Select screen**

**IMPORTANT!** Machine model must be selected during initial setup before operating the machine.

**Machine Select** must be done when the P3 PULSE is set up for the first time. Once you have selected your machine, P3 sets up the default settings for that model.

- From the **Settings** screen, use the Up or Down arrows to navigate to **Select Machine**, then press
- Press the Up or Down arrows to find your machine model.
- Press to save your selection and P3 returns back to **Settings** menu.
- Pressing Home icon exits to the **Settings** screen without saving your selection or changing any settings.

**Enter Password**

This password protected menu provides access to P3 program settings. This menu is only used by the factory for initial P3 machine setup parameters.
4.6 Ladder Hitch Kit

(If equipped)

The Ladder Hitch provides an adjustable hitch height for the tow vehicle.

The 2” ball coupler has three height positions and includes two, 3 ft (1 m) 1/4” safety chains with snaps.

- Lower the coupler down onto the hitch ball. Make sure the ball clamp is under it.
- Hand-tighten the coupler by pushing down on it and turning the hand wheel clockwise.
- Turn the hand wheel until the coupler is tight. Make sure the hitch ball is properly seated by pushing back on the chipper. Recheck that the hand wheel is tight.
- Check all connections at each stop. Make sure the hitch and hitch-ball are securely attached to your tow vehicle and that the trailer coupler is properly connected to the hitch-ball.

4.7 Clean-out Tray

(If equipped)

The Clean-out Tray is available as an add-on accessory for the chipper. It catches fine debris under the feed rollers and prevents it from falling out onto the ground.

With the tray closed, debris is caught inside the roller housing saving clean-up underneath the chipper.

Empty debris out of the roller housing by pushing the Clean-out Tray lever forward.
5. Operating Instructions

5.1 Before Startup

1. Check the engine oil level. See page 35.
2. Check the hydraulic oil level. See page 35.
3. Open the fuel valve. Check the fuel level. See page 36.
4. Check the engine air cleaner. See page 49.
5. Review the Safety Rules on page 8.
6. Clear the area of bystanders, especially small children.
7. Make sure each operator is trained and familiar with the set up and operation of the wood chipper.
8. Perform the Pre-operation Checks.
9. Review the Controls (see page 21).
10. Survey the work site and place the chipper in a clear, level work area.
11. Set up the machine correctly. See Machine Setup page 36.

5.2 Pre-operation Checks

Check the following each time the wood chipper is used:

<table>
<thead>
<tr>
<th>Pre-operation Checklist</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check the machine has been lubricated following the schedule outlined in the Maintenance section.</td>
</tr>
<tr>
<td>Check the tension and alignment of the belts. Adjust as required.</td>
</tr>
<tr>
<td>Check the rotor housing and discharge chute. Remove any blockages, twine, wire or other material that has become entangled.</td>
</tr>
<tr>
<td>Check the condition and clearance of the twig breaker, rotor and stationary blades. Adjust or replace as required.</td>
</tr>
<tr>
<td>Check condition of the battery and other electrical components. Keep all components in good condition.</td>
</tr>
<tr>
<td>Check for hydraulic leaks. Tighten connections or replace components to stop leaks.</td>
</tr>
<tr>
<td>Check and ensure that all covers, guards and shields are in place, secured, and can function as designed.</td>
</tr>
<tr>
<td>Check that all bearings are properly greased. Replace if they do not turn freely.</td>
</tr>
<tr>
<td>Check and inspect tires, wheels, and hubs.</td>
</tr>
<tr>
<td>Check hydraulic fluid level. Top level up as required.</td>
</tr>
<tr>
<td>Check and tighten all fasteners. Make sure the equipment is in good condition.</td>
</tr>
<tr>
<td>Check that appropriate equipment for personal protection is available and being used.</td>
</tr>
<tr>
<td>Check that jewelry, loose-fitting clothing are not worn. Make sure long hair is tied back.</td>
</tr>
</tbody>
</table>
5.3 Machine Break-In

Although there are no operational restrictions on the wood chipper when used for the first time, it is recommended that the following mechanical items be checked:

**After 1–5 hours of operation:**
1. Review the engine operator's manual for break-in information.
2. Inspect the axle, tires, and wheel hubs. Check wheel nut torque.
3. Check tire pressure. Inflate as required.
4. Check sheave alignment. Re-align if required. See page 52.
5. Check belt tension. Adjust if required. See page 51 and page 52.
6. Visually check condition of rotor bearings.
7. Check the condition and clearance of the twig-breaker, rotor and ledger blades. Adjust as required.
8. Check for entangled material. Remove all entangled material before resuming work.
9. Check condition of electrical and hydraulic components. Keep all components in good condition.
10. Check all fluid levels. Top up as required.
11. Check torque on fasteners and hardware.

**After 8 hours of operation:**
12. Repeat all previous steps.
14. Perform all the checks in the Pre-operation Checks. See page 33.

5.4 Fuel Level Check

**Check the fuel level daily.** Starting with a full tank helps to eliminate or reduce operating interruptions for refueling.

The fuel tank is located on the front right-hand side of the machine. Avoid running the tank dry.

**5.4.1 Refueling**

Fuel tank capacity: 6.5 US gal (24.6 L).

**WARNING!**

Fuel vapors can explode causing injury or death. Do not smoke while refueling. Keep sparks, flames, and hot components away.

Refuel in a well-ventilated area with the engine stopped. If the engine has been running, allow it to cool first. Never refuel the engine inside a building where gasoline fumes can come in contact with flames or sparks.

For fuel specification, see Engine Fuel on page 43. Refer to the engine manual for additional information on fuels.

1. Clean the area around fuel tank cap. Fill the tank to 1/2" (12 mm) below bottom of filler neck to provide space for any fuel expansion. **Do not overfill.**
2. Install fuel fill cap securely and wipe up any spilled fuel.
5.5 Engine Oil Level Check

Check engine oil level daily. Check with the machine parked on level ground and the engine stopped.

IMPORTANT! Running the engine with a low oil level can cause engine damage that is not covered by warranty.

1. Remove the oil level dipstick and wipe it clean.
2. Fully insert the oil level dipstick, then remove it to check the oil level.
3. If the oil level is low, remove the oil filler cap and add oil until the level is at the FULL mark on the oil level dipstick. SAE 10W-30 or 5W-30 is recommended for general use.
4. Reinstall the oil level dipstick and oil filler cap.

Refer to the engine owner's manual included in the manual tube for further information on engine oils.

5.6 Hydraulic Oil Level Check

Check hydraulic oil level daily. The hydraulic oil tank is located on the front of the machine. There is a sight glass on the tank to view oil level.

Check with the machine parked on level ground and the engine stopped.

The proper level is when the oil is visible in half the glass window. If the level is not visible in the sight glass, add oil.

IMPORTANT! Do not operate machine if oil level is not visible in the sight glass. Damage to the pump and other components can occur.

Do not overfill the tank past the sight glass window.

IMPORTANT! Hydraulic oil quality should be inspected every 50 hours. If the oil is dirty or smells burnt, it should be replaced.

IMPORTANT! Be aware of high oil temperatures. Temperatures higher than 180 °F (82 °C) could cause seal damage and degrade oil quality.

5.6.1 Adding Oil to the Tank

The hydraulic system uses Dexron® III ATF.

1. Clean the area around filler cap and remove it.
2. Use a clean funnel and add oil until the level fills half of the sight glass window.
3. Install filler cap securely. Wipe up any spilled oil.

Check levels after changing filters or servicing hydraulic components.
5.7 Machine Setup

CAUTION!

Park the machine so prevailing winds blow exhaust gases / fumes away from the operator.

CAUTION!

Risk of injury from ejected wood chips. Chipper rotor can expel wood chips fast enough to cause injury or damage.

Direct chute discharge away from work area, people, animals, and objects.

1. Use the tow vehicle to position the wood chipper at the work site. Leave the chipper attached to the tow vehicle (if used) for greater stability. Lower the rear jack.
2. With no tow vehicle available, chock the wheels and lower the jacks so that the machine is stable.

3. On the rear of the feed table, pull the latches inward and lower it.

4. On the right-hand side, lock the feed table in the lowered position.

5. Point the discharge chute in the desired direction. Adjust the hood deflector as required.

Fig. 34 – Machine Setup
1. Rear Jack Stand
2. Wheel Chocks
3. Crank Jack

Fig. 35 – Feed Table Latches

Fig. 36 – Feed Table Lowered

Fig. 37 – Discharge Chute
5.8 Starting the Engine

**WARNING!**

Engine exhaust contains carbon monoxide, an odorless, poisonous gas. Breathing it can cause unconsciousness or death.

Never operate engine in a closed, or even partly closed area. Exhaust gases can build up to dangerous levels.

**NOTE:** For more detailed instructions, refer to the engine manufacturer owner's manual found in the manual tube.

Before starting the engine, the wood chipper should be checked over, set up to work and ready to run.

1. If the engine is cold, pull out (close) the choke. To start a warm engine, leave the choke pushed in.
2. Move the throttle lever up to 1/4 throttle position.
3. Turn the ignition key switch fully clockwise to engage the starter. Release the key when the engine starts.
4. Leave the engine operating at low throttle for a few minutes to allow it to warm up. Gradually push the choke control knob in as the engine warms.

**IMPORTANT!** Allow the engine to warm up before moving throttle lever to MAX.

5. Once the engine is warmed, push the throttle lever up to MAX before starting chipping operation.

**NOTE:** Throttle must be at MAX position to begin chipping operation. When not at MAX, P3 displays LOW RPM when in Forward feed.

5.9 Stopping Procedure

1. Stop feeding material into the hopper. Allow the machine to run for a few minutes so the chipper clears itself.
2. Decrease engine speed to MIN.
3. Turn the ignition key switch fully counter-clockwise to turn the engine off.

**CAUTION!** Risk of injury from rotating parts. Wait for all parts to stop moving before attempting to access the machine. Rotor continues to turn for a few minutes after the engine has stopped.

5.10 Stopping in an Emergency

**In an emergency**
- Turn the ignition switch to the OFF position.
- Correct fault situation before restarting engine and resuming work.
5.11 Chipping Operation

The Wallenstein wood chipper is a strong, rugged machine that is built to provide consistent chipping of logs up to 5" (125 mm) in diameter.

**WARNING!**
Risk of serious injury or death. Keep hands, feet and clothing away from feed rollers when the chipper is operating. Do not climb onto the feed table or hopper.

**WARNING!**
Never reach into the feed hopper. Doing so risks hands getting caught. Use a stick or branch to push in any material that does not move on its own.

If jammed, stop the engine, wait for the rotor to stop, then clear the jam.

**IMPORTANT!** Do not put metal objects, bottles, cans, rocks, glass or other foreign material into wood chipper. If such items happen to get into the chipper, stop machine and turn engine off. Wait for all moving parts to stop before removing material. Inspect machine for damaged or loose parts before resuming work.

- De-limb large branches and trees. The limbs on large branches sticking out of the feed hopper may catch the roller feed control bar, and shut the rollers off.
- Be aware of the size and shape of the material. Complicated, curved branches and logs can move in unpredictable ways as they pass through the feed rollers. Large curved pieces should be cut to smaller straighter sections.
- Hold small diameter branches together in a bundle and feed in together.
- Place short branches on top of longer ones to avoid reaching into the hopper.

**P3 PULSE**
- P3 control system prevents the engine from getting bogged down if material is put into the chipper too quickly. Feed roller speed is regulated by monitoring the rotor rpm. For information on setup, see P3 PULSE Electronic Control System on page 25.

**Procedure:**

1. Check the engine is warmed, at MAX throttle setting, and the rotor is up to speed. Once the rotor is up to speed, P3 PULSE starts the feed rollers when the feed roller control bar is placed in the Forward (feed) position.

**NOTE:** Engine throttle must be at MAX and rotor at full speed for feed rollers to function in Forward. Feed rollers function in Reverse even at engine idle so material can be backed out.

2. Move the feed roller control bar out of the Stop position. Lift up the detent reset lever to release it.

3. Push the control bar forward to the first detent position to start the Forward feed. The control bar stays in this position until moved.

**NOTE:** The control bar can move freely between Forward and Reverse without locking. Reversing the feed rollers can be manually controlled with the feed control handle at any time, even at engine idle. The rotor does not have to be turning for Reverse to work.

![Detent Reset Lever](00119)
4. Stand to the side of the feed table and slowly slide material into the feed rollers. Do not force the material. The material is drawn in as it engages the rollers. **When operating this equipment always have at least two workers present and trained in safe operation of the machine.**

5.12 Unplugging the Chipper

The wood chipper is designed to handle a wide range of material sizes without any problem. However, in the event material gets lodged in the chipper, follow this procedure to clear the blockage.

1. Before shutting the engine off, reverse the feed rollers to remove the material from the feed hopper.

2. **Place the machine in a Safe Condition before proceeding further. See page 8.**

3. Clear all the material out of the feed hopper. Make sure nothing is jammed or wedged between the feed rollers and the rotor. If material is jammed in this area, proceed to Step 7.

If the chipper is still plugged or the engine has shut down, the jammed material must be removed by hand.

**CAUTION!**

The chipper blades are very sharp. Use caution when reaching into the rotor compartment to clear stuck material.

4. Remove the rotor housing flange bolt and open the housing. Clear out any jammed material inside.

**NOTE:** As a safety precaution, the engine will not start if the rotor hood is open.
5. Pull out any material remaining in the feed hopper and discharge hood. Use a stick to free up any material jammed into the discharge hood.

6. Make sure all the material is removed and nothing is jammed or wedged between the input opening and the rotor before start up.

If debris remains jammed or wedged between the input opening and the rotor, proceed to Step 7.

If material gets jammed in the chipper to the point where the rotor speed slows to zero, the P3 system shuts the engine down.

**Chipper Severely Plugged**

If the previous steps do not clear the blockage, the upper feed roller can be raised to clear the debris between the input opening and the rotor. That material can then be pulled back out of the feed table.

7. Remove the Bridge Guard Cover to access the end of the Toplink.

8. Remove the pin and extend the Toplink out so the rod end can be pinned to the Bridge.

9. With the Toplink connected to the Bridge, wind in the Toplink so it shortens and raises the upper roller.

10. With the upper roller raised, carefully reach into the roller housing from inside the feed hopper to clear out the debris.

11. If required to dislodge material in or around the rotor, slowly turn the rotor by hand very carefully. **Do not reach into the roller housing while the rotor is moving.**

12. With the debris cleared, extend the Toplink to lower the upper roller back into position.

13. Disconnect the Toplink from the bridge, shorten it up, and reconnect it to its support. Reinstall the bridge cover.

14. Restart the chipper and resume operations.

**IMPORTANT!** Do not operate the chipper with the Toplink connected to the bridge. Damage to the machine can occur.
5.13 Transporting

Follow these steps before transporting the machine.

1. Turn the engine off and clean the machine. Remove all debris.
2. Close the fuel valve.
3. Swing feed table up into the upright position. Secure it with the latches.
4. Make sure the chipper is securely attached to the tow vehicle. Connect the safety chains to the tow vehicle, crossed underneath the chipper tongue.
5. Raise the crank jack. Rotate and secure it in the transport position with the pin.
6. Connect the electrical harness cable to the tow vehicle. Check that all the lights and reflectors are in place, clean, and working.
7. Turn the discharge hood toward the feed table so it is pointed towards the rear of the machine.
8. Check tire air pressure. Inspect tires for any damage. Check lug nut torque and tighten if necessary.
9. Inspect and replace any axle dust caps if damaged or leaking.
10. Check that all components on the chipper are secure for travel. Check for any lose tools or other items. Make sure the toolbox cover is closed.

---

**Fig. 46** – Close Fuel Valve

**Fig. 47** – Wood Chipper Transport Position

1. Light Harness Connected
2. Ball Hitch Secured
3. Chute Turned
4. Feed Table Stowed and Latched
5. Jack Leg Raised
6. Safety Chains Attached
5.14 Storage

- If the machine is not going to be used for a period of time, put the chipper away in storage.
- Store the unit in an area away from human activity.
- Do not let children play on or around the stored machine.
- Store the unit in a dry, level area.
- Perform the following measures to ensure a smooth start-up before putting the chipper back to work. Completely inspect all major systems. Replace or repair any worn or damaged components.

**IMPORTANT!** Review the engine owner's manual to prepare the engine for storage.

5.14.1 Placing Chipper in Storage

1. Store the chipper in an area away from human activity. It is best to store the machine indoors. If that is not possible, cover it with a water-proof tarp.

2. Add fuel stabilizer to the fuel tank. Start the engine and leave it operating for a few minutes to make sure the treatment gets throughout the fuel system. Fill the fuel tank to prevent condensation.

3. Close the fuel valve.

4. Remove the battery and store it indoors. Connect a battery maintainer to keep it fully charged. Check it monthly.

5. Inspect all rotating parts and remove any entangled material. Remove all debris from the machine.

6. Thoroughly clean the machine.

7. Grease the machine and lubricate all hinges.

8. Check the condition of the belts and pulleys. Replace or adjust as required.

9. Raise up the feed table and secure it. Rotate the discharge chute towards the back of the machine.

10. Touch up all paint nicks and scratches to prevent rusting.

5.14.2 Removing from Storage

1. Check through the measures listed in the Pre-operation Checks. See page 33.

2. Review the Safety (page 49) and Operation procedures (page 36).

3. Install and reconnect the battery.

4. Open the fuel valve.
6. Service and Maintenance

6.1 Maintenance Safety

- Always place the machine in a safe service position before performing any service work, maintenance procedures, or storage preparation. The **Safe Condition** is as follows:

  - Shut off engine. Remove ignition key.
  - Make sure all moving parts have stopped.
  - Disconnect battery ground (-) cable.
  - Block or chock wheels.

- Follow good shop practices:
  - Keep service area clean and dry.
  - Be sure electrical outlets and tools are properly grounded.
  - Use adequate light for the job at hand.

- Never operate the machine or the towing vehicle in a closed building. The exhaust fumes may cause asphyxiation.

- Allow the engine to cool before performing maintenance. Engine components and oil may be hot enough to cause injury.

- Never work under equipment unless it is properly supported.

- When performing any service or maintenance work always use personal protective equipment.

- Where replacement parts are necessary, use only OEM parts to restore your equipment to original specifications. The manufacturer is not responsible for injuries or damages caused by use of unapproved parts or accessories.

- Inspect and tighten all bolts, nuts and screws. Check that all electrical and fuel connections are properly secured.

- When completing a maintenance or service function, make sure all safety shields and devices are installed before placing chipper in service.

- Always use proper tools in good condition. Make sure you understand how to use them, before performing any service work.

6.2 Fluids and Lubricants

1. Engine Oil

SAE 10W-30 or 5W-30 motor oil is recommended for general use. Refer to the engine manufacturer's manual for maintenance and service information.

2. Grease

Use an SAE multi-purpose high temperature grease with extreme pressure (EP) performance. Also acceptable is an SAE multipurpose lithium-based grease.

3. Engine Fuel

This engine is certified to operate on unleaded gasoline with a pump octane rating of 86 or higher (a research octane rating of 91 or higher).

4. Hydraulic Oil

Use Dexron® III ATF for all operating conditions. Dexron VI or Mercon® are acceptable substitutes.

5. Storing Lubricants

Your machine can operate at top efficiency only if clean lubricants are used. Use clean containers to handle all lubricants. Store them in an area protected from dust, moisture and other contaminants.
6.3 Maintenance Schedule

Perform maintenance procedures at time shown or hour interval, whichever comes first.

<table>
<thead>
<tr>
<th>As Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check the condition of all hydraulic lines, hoses and fittings. Replace any that are damaged.</td>
</tr>
<tr>
<td>Visually check drive belt tension.</td>

</tr>
</tbody>
</table>
6.4 Grease Points

Use a hand-held grease gun for all greasing. Pump one shot of grease per fitting.

- Wipe grease fitting with a clean cloth before greasing to avoid injecting dirt and grit.
- If fittings do not take grease, remove and clean them thoroughly. Replace grease fittings as necessary.

7. Feed Roller Hydraulic Motors
8. Pump Drive Sheave
9. Hydraulic Gear Pump
10. Control Valve
11. Pressure Line
12. Suction Strainer
6.6 Hydraulic Oil – Changing

CAUTION!

Risk of burns to exposed skin. Hydraulic oil becomes hot during operation. Hoses, lines and other parts become hot as well. Wait for the oil and components to cool before starting any maintenance or inspection work.

Change the hydraulic oil at 100 hours of operation or annually. Clean the return filter and suction strainer in the hydraulic tank at the same time.

- Hydraulic oil type: Dexron III ATF.
- Hydraulic oil tank capacity: 5 US gal (19 L)

The hydraulic tank drain plug is located under the machine. An Allen wrench is required to remove it.

Procedure

1. Have a drain pan ready of suitable capacity.
2. Clean the area around drain and remove the drain plug.
3. Allow the oil to fully drain, then flush the tank. Dispose of used oil in an environmentally acceptable fashion.
4. Install the drain plug.
5. Clean the filter suction strainer before filling the tank.

6.6.1 Clean Suction Strainer

With the hydraulic tank emptied, the suction strainer should be removed and cleaned. The strainer is made of stainless steel screen and is reused.

The suction strainer is located on the back of the tank, between the fuel tank and the battery box.

1. Remove the suction hose, then remove the strainer.
2. Place the suction strainer in a solvent tank and use a small brush to clean it. Examine the strainer screen and replace it if there are holes or damage.
3. Dry the suction screen thoroughly, then re-install.
6.6.2 Hydraulic Oil Filter – Cleaning

With the hydraulic tank emptied, the hydraulic return filter should be removed and cleaned. The filter is made of stainless steel screen and is reused.

The filter is located on top of the hydraulic oil tank.

Procedure

**CAUTION!**

Risk of burns to exposed skin. Hydraulic oil becomes hot during operation. Hoses, lines and other parts become hot as well. Wait for the oil and components to cool before starting any maintenance or inspection work.

1. Have a drain pan ready to catch any dripping oil.
2. Remove the three screws on the filter cover and pull the cover off.
3. Remove the filter element and clean the bottom of the bowl.
4. Check that the O-rings are not damaged. If they are, replace them.
5. Place the filter element in a solvent tank and use a small brush to clean it. Examine the screen and replace it if there are holes or damage.
6. Reinstall the filter cover and tighten the screws to 44 lbf•in (5 N•m).
7. Fill the tank with clean oil. The proper oil level is when it is visible in half the glass window.

6.7 Engine Air Cleaner

Check air cleaner every 50 hours of operation. Check it more frequently during dusty, dirty conditions.

Change air filter elements at 100 hours of operation or annually.

A dirty air filter can restrict air flow to the carburetor, reducing engine performance. If the engine is operated in very dusty areas, clean the air filter more often than specified.

**IMPORTANT!** Operating the engine without an air filter, or with a damaged air filter, can allow dirt to enter the engine, causing rapid engine wear. This type of damage is not covered by Warranty.

Inspection

Remove the air cleaner cover and inspect the filter elements. Clean or replace dirty filter elements. Always replace damaged filter elements.

**NOTE:** Refer to the engine manual for further information on servicing the air cleaner.
6.8 Servicing the Battery

Review Battery Safety on page 10.

### CAUTION!

Risk of explosion or fire! Do not let metal objects come in contact with the battery terminals. Arcing can cause a fire or explosion. Cover terminals if working near batteries.

### CAUTION!

Risk of burns! Battery electrolyte is extremely corrosive and poisonous. Contact with the eyes, skin or clothing can result in severe burns or other serious personal injury. If contact occurs seek medical attention immediately. Handle batteries carefully.

### CAUTION!

Battery posts, terminals and related accessories contain lead and lead compounds. These chemicals are known to cause cancer and birth defects or other reproductive harm. Wash hands after handling.

6.8.1 Removing the Battery
1. Disconnect negative (−) cable first, then positive (+) cable.
2. Remove battery hold-down bracket and battery from machine.

6.8.2 Installing the Battery
1. Install battery hold-down bracket.
2. Coat terminals with dielectric grease or petroleum jelly.
3. Connect positive (+) cable first, then negative (−) cable.

6.8.3 Cleaning the Battery
1. Disconnect negative (−) cable first, then positive (+) cable.
2. Clean battery cable ends and terminals with wire brush. Rinse with a weak baking soda solution.
3. Coat terminals with dielectric grease or petroleum jelly.
4. Connect positive (+) cable first, then negative (−) cable.

6.8.4 Charging the Battery
Be familiar with procedures for charging and testing a battery. Read and follow the manufacturer’s instructions for the battery charger.

### WARNING!

Charging a frozen battery can cause it to explode. Warm the battery to 60 °F (16 °C) before charging.

Remove the battery from the machine to recharge it.
1. Use a battery carrier to lift the battery or place hands at opposite corners to avoid spilling electrolyte.
2. Place battery in a well-ventilated area.
3. Connect positive (+) lead of charger to positive (+) terminal, and negative (−) lead to negative (−) terminal.
4. Charge battery according to the instructions from battery charger manufacturer and battery manufacturer.

6.8.5 Jump Starting
Booster battery must be 12-volt, or installed in a system that is 12-volt, negatively grounded.
1. Connect positive (+) jumper cable to positive terminal of discharged battery.
2. Connect the other end of the same jumper cable to positive (+) terminal of booster battery.
3. Connect one end of the second jumper cable to negative (−) terminal of booster battery.
4. Make the final jumper cable connection to engine block or the furthest ground point, away from the discharged battery and fuel tank.
5. Start engine.
6. After engine starts leave cables connected for one to two minutes.
7. Disconnect jumper cables in reverse order of installation.
8. Operate unit as normal to charge battery.
6.9 Hydraulic Pump Drive Belt Replacement

Allow the engine and components to cool beforehand.

Procedure

1. Remove the lower drive belt shield (1).

2. Loosen, but do not remove the two bolts holding the pump mounting plate (2).

3. Loosen the jam nut (3) slightly on the top of the adjustment bolt.

4. Back off the belt tension adjuster nut (4) on the bottom of the mounting plate. Loosen enough so the drive belt can be removed.

5. Install the new belt and adjust belt tension.

6.10 Pump Drive Belt Tension

Proper drive belt tension is set by checking belt deflection.

Procedure

1. With the belt installed, tighten the belt tension adjuster nut (item 4, Fig. 60) to remove the slack from the belt.

2. Push on the drive belt by hand to check its deflection. It should not deflect more than 3/8"–7/16" (10 mm–12 mm). Adjust accordingly.

3. With the correct belt deflection set, tighten the jam nut.

4. Recheck belt tension after 10 hours of operation.
6.11 Rotor Drive Belt Replacement
Allow the engine and components to cool beforehand.

**Procedure**
1. Remove both upper and lower drive belt shields (1).

![Fig. 62 – Upper and lower drive belt shields](image1)

2. Remove pump drive belt. See Pump Drive Belt Replacement page 51.
3. Loosen (do not remove) the four engine mount nuts (3) that secure the engine sub frame to the main frame.

![Fig. 63 – Engine mount](image2)

4. Loosen the jam nut on the belt tension adjuster (4).
5. Back off the belt tensioning nut (5) until the drive belt is loose enough to remove.
6. Install the new belt, check sheave alignment and adjust belt tension.

**IMPORTANT!** Check sheave alignment after changing the drive belt.

6.12 Sheave Alignment

**Procedure**
1. Place a straight edge along the front face of the rotor sheave. Make sure the space is equal between the drive belt along the length of the straight edge. Adjust accordingly.

![Fig. 64 – Sheave alignment](image3)

6.13 Rotor Drive Belt Tension
Proper drive belt tension is set by adjusting belt deflection.

**Procedure**
1. Turn in the belt tension adjuster nut to set belt tension.
2. Push on the drive belt by hand to check its deflection. It should not deflect more than 3/8"–7/16" (10 mm–12 mm). Adjust accordingly.
3. Tighten the jam nut.
4. Recheck belt tension after 10 hours of operation.
6.14 Upper Feed Roller Tension Adjustment

The feed rollers pull material from the hopper into the chipper. The lower roller is fixed. The upper roller is mounted on hinged pivot arms so it can move up and down with different sizes of material. Spring tension on the upper pivot arms hold the roller down on the material as it is fed into the chipper.

Adjust spring tension tighter for smaller material, and looser for larger material.

If spring tension needs to be adjusted, follow these steps:

Procedure

1. On the underside of the machine, loosen the jam nuts (1) on the spring tensioners. Hold the upper nut with a wrench while loosening the jam nut.

2. Turn the adjuster nut to set spring tension as required. The upper roller should grip material and move up and down with different material sizes.

3. Hold the adjuster nut with a wrench and tighten the jam nut.

   IMPORTANT! Set tension on both sides equally. Measure the length of adjustment threads as a check.

Fig. 66—Upper feed roller tensioner (US model shown)

6.15 Rotor Blades – Changing

Check rotor blade sharpness daily.

Check blade sharpness more often if processing material with a lot of sand, soil or dirt in it. If the chipper is not pulling the material or material has to pushed into the chipper, the rotor blades are probably dull.

Keeping the blades sharp reduces the amount of power required during operation. Reverse or sharpen the blades if the cutting edge becomes dull.

Procedure

1. Remove the blades from the rotor to sharpen. Sharpen at a 45° angle to provide the best cutting effect.

   IMPORTANT! Make sure equal amount of material is removed from each blade when sharpening to maintain proper rotor balance.

   CAUTION! Risk of getting hands pinched or wedged between lower rotor housing and rotor. Turn rotor slowly and be aware of hand positioning.

2. Install rotor blades with leading edge out, towards the ledger blade. Tighten the blade mounting bolts to 45 lbf-ft (63 N·m).

   IMPORTANT! If replacing or sharpening a blade, do the opposite one on the rotor as well to maintain rotor balance. Ledger knife clearance must be equal.

Fig. 67—Rotor blade leading edge
6.16 Ledger Knife – Checking

Observe ledger knife performance daily. Check the ledger knife sharpness every 50 hours.

The ledger knife is bolted inside the lower rotor housing assembly. As the rotor turns, material fed into the chipper is sheared off at the ledger knife by the rotor blades.

When the corner of the ledger knife facing the rotor blade rounds over, the blade can be removed and re-installed with a different corner facing the rotor blade. Once all four corners have been rounded, remove the knife to sharpen or replace it.

To obtain the best chipper performance, check the clearance between the rotor blade and stationary ledger blade every 50 hours.

6.16.1 Ledger Knife Clearance

Use the ledger setting gauge to check knife clearance. The thickness of the gauge is the correct ledger blade clearance. If spacing is in excess of the gauge thickness, adjust the clearance.

NOTE: The actual clearance between the rotor blades and the ledger knife is 1/32"–1/16" (.76–1.52 mm).

---

Checking

1. Open the upper rotor housing.

<table>
<thead>
<tr>
<th>CAUTION!</th>
</tr>
</thead>
<tbody>
<tr>
<td>Risk of getting hands pinched or wedged between lower rotor housing and rotor. Turn rotor slowly and be aware of hand positioning.</td>
</tr>
</tbody>
</table>

2. Turn the rotor by hand so that one rotor blade edge is next to the ledger knife.

3. Slide the end of the ledger gauge down between the rotor blade and the ledger knife.

4. Turn the rotor past the ledger knife with the gauge inserted between them to check clearance. The gauge should be tight. Check all four knives.

Adjusting

5. Loosen the jam nuts on the outside of the ledger knife support.
6. Turn the adjuster nuts (2) clockwise so the ledger knife slides firmly up against the gauge inside the rotor housing. Remove the ledger knife gauge.

7. Tighten the jam nuts (1).

**6.17 Ledger Knife – Changing**

The ledger knife is removed through the bottom of the chipper.

**Procedure**

1. Loosen the outside jam nuts (1) and the inside adjuster nuts.
2. Remove the three bolts (2) holding the ledger knife in place to allow the blade to fall through the bottom of the chipper.
3. Rotate the ledger knife or replace it.
4. Reverse the above steps to reinstall the knife.
5. Verify clearance before tightening.

**6.18 Twig Breaker**

Inspect the twig breaker for damage, bent or missing teeth every 50 hours.

The twig breaker is located inside the lower rotor housing. Material in the chipper is broken up into smaller pieces as the discharge paddles rotate past it.

A damaged or worn twig breaker should be replaced.
6.19 Fuel Filter – Changing

The fuel filter is located on the right-hand side of the engine. Allow the engine to cool before beginning.

1. Turn the fuel supply off at the fuel shut-off valve.
2. Remove the gear clamps on either side of the filter. Pull it off the hoses and install a new one.
3. Install and tighten the gear clamps, then turn the fuel supply back on.

Fig. 74—Engine Fuel Filter

1. Fuel Filter
2. Fuel Shut-off Valve

6.20 Electrical System – General

IMPORTANT! When assembling or replacing wire harnesses, apply a thin coating of silicone dielectric grease to the harness connectors.

Clean off any corrosion or loose particles, then apply a small amount to the surfaces of the connectors where they meet. The grease helps to stop any possibility of future corrosion.

Reassemble the connection. Wipe off any grease that squeezes out.

IMPORTANT! If welding on the machine becomes necessary, sensitive electronic components must be removed from the machine beforehand. Welding can produce stray voltage spikes that can damage these items.

- Disconnect and remove the P3 Display and Controller from the machine.
- Disconnect/unhook the machine from the tow unit, tractor, or carrier machine.
- Disconnect the machine’s battery (as equipped). Disconnect the negative battery cable first before disconnecting the positive battery cable.
- Place the welder ground clamp as close to the work area as possible. Keep the welder cables away from the control system electrical harnesses.
### 6.21 Troubleshooting

The following table lists some problems that may be encountered, with possible causes and solutions.

If a problem persists after reading through the Troubleshooting section, contact your local dealer, distributor or Wallenstein. Have the serial number ready.

<table>

7.1 Bolt Torque

Checking Bolt Torque

The tables shown give correct torque values for various bolts and capscrews. Tighten all bolts to the torque values specified in the table, unless indicated otherwise. Check tightness of bolts periodically.

**IMPORTANT!** If replacing hardware, use fasteners of the same grade.

**IMPORTANT!** Torque figures indicated in the table are for non-greased or non-oiled threads. Do not grease or oil threads unless indicated otherwise. When using a thread locker, increase torque values by 5%.

**NOTE:** Bolt grades are identified by their head markings.

7.2 Hydraulic Fitting Torque

Tightening Flare Type Tube Fittings

1. Check flare and flare seat for defects that might cause leakage.
2. Align tube with fitting before tightening.
3. Hand-tighten swivel nut until snug.
4. To prevent twisting the tube, use two wrenches. Place one wrench on the connector body and tighten the swivel nut with the second. Torque to values shown.

If a torque wrench is not available, use the FFFT (Flats From Finger Tight) method.

Values shown are for non-lubricated connections.

7.3 Wheel Lug Torque

It is extremely important safety procedure to apply and maintain proper wheel mounting torque on your trailer axle. Torque wrenches are the best method to assure the proper amount of torque is being applied to a fastener.

Wheel lugs should be torqued before first road use and after each wheel removal. Check and re-torque after the first 10 miles (16 km), 25 miles (40 km), and again at 50 miles (80 km). Check periodically thereafter.

**NOTE:** Wheel lugs must be applied and maintained at the proper torque levels to prevent loose wheels, broken studs, and possible dangerous separation of wheels from your axle.

- Start all lugs by hand to prevent cross threading.
- Tighten lugs in sequence, per wheel lug torque sequence chart.
- The tightening of the fasteners should be done in stages. Following the recommended sequence, tighten fasteners per wheel torque requirements chart.

8. Product Warranty

LIMITED WARRANTY

Wallenstein products are warranted to be free of defects in materials and workmanship under normal use and service, for a period of

Five Years for Consumer Use
Two Years for Commercial/Rental Use

from the date of purchase, when operated and maintained in accordance with the operating and maintenance instructions supplied with the unit. Warranty is limited to the repair of the product and/or replacement of parts.

This warranty is extended only to the original purchaser and is not transferable.

Repairs must be done by an authorized dealer. Products will be returned to the dealer at the customer’s expense. Include the original purchase receipt with any claim.

This warranty does not cover the following:

1) Normal maintenance or adjustments
2) Normal replacement of wearable and service parts
3) Consequential damage, indirect damage, or loss of profits
4) Damages resulting from:
   • Misuse, negligence, accident, theft or fire
   • Use of improper or insufficient fuel, fluids or lubricants
   • Use of parts or aftermarket accessories other than genuine Wallenstein parts
   • Modifications, alteration, tampering or improper repair performed by parties other than an authorized dealer
   • Any device or accessories installed by parties other than an authorized dealer
5) Engines. Engines are covered by the manufacturer of the engine for the warranty period they specify. For the details of your engine warranty, see your engine owner’s manual. Information about engine warranty and service is also available in the FAQ section at www.wallensteinequipment.com
